Ref: 6056_301040 **Date:** 28 March – 1 April 2027 **Location:** Amman (Jordan) **Fees:** 4200 Euro

Introduction

The electrical fault analysis, remedies, and power system course delves into the methodology for calculating fault currents in practical electrical power systems. The electrical fault analysis, remedies, and power system course is imperative in the context of electrical safety to analyze subjects to short-circuit currents as they carry significant destructive energy.

The equipment must have adequate short-circuit ratings to handle such high currents. Precise computation of these currents is critical for calibrating system protection devices accordingly. Industry-standard analysis techniques are elucidated in this electrical fault analysis, remedies, and power system course.

In this electrical fault analysis, remedies, and power system course, a comprehensive engineering software package is employed throughout the seminar to ensure detailed attention and minimize simplifications. The curriculum emphasizes applying these techniques to actual systems, ranging from system analysis preparation and manual and computer-aided calculation processes to the final application of results.

Practical examples aligned with industrial standards are provided to help engineers become adept at following and applying the necessary procedures. Additionally, the electrical fault analysis, remedies, and power system course introduces industry software that simplifies the modeling and analysis of complex electrical systems, facilitating more accessible fault analysis. However, understanding and interpreting the software-generated results remains essential, as inaccuracies in input data can lead to unreliable outcomes.
